

Internship report

I am grateful for the opportunity to work and learn at NextGen AI Technologies as a Backend Development Intern, where I contributed to improving platform reliability, maintainability, and overall system quality across both backend and frontend workflows.

My work included implementing ownership metadata and audit trail functionality to support better auditing, traceability, and accountability across platform records by introducing standardized ownership tracking and update history mechanisms. I also contributed to integrating knowledge bases into agents to improve agent capabilities and enable more effective use of contextual information during execution. In addition, I worked on the portable agent export and import functionality to make it easier and more reliable to transfer agents between different environments and organizations. This involved strengthening validation and dependency handling for knowledge bases, voice providers, and other integrations, improving re-upload behavior for KBs, preventing invalid dependency mappings, and providing clearer feedback during migration operations. Alongside feature development, I supported quality assurance and code review activities across frontend and backend branches, helped identify and resolve issues before release, collaborated on implementation decisions, and contributed to real-time agent updates and frontend integration improvements. I am currently working to improve platform logging by adopting structured logging practices, using Winston and Pino browser to enhance monitoring, debugging, and production readiness across the platform.

Going forward, I aim to continue providing value to NextGen AI by contributing to the continued improvement and growth of the platform 2.0 as it evolves. I am eager to take on larger and more complex initiatives that create meaningful impact across platform performance, scalability, reliability, and user experience. I also look forward to expanding my experience by working across more areas of development, including agent-related features, integrations, and new application development opportunities for the Prime app. By building on my experience across platform enhancements, validation, testing, and cross-team collaboration, I hope to contribute to delivering impactful solutions and supporting the continued growth of the NextGen AI ecosystem.
